Hydrant Pressure Monitoring

Five of the most popular uses of Telog's HPR-31, hydrant pressure recorder, are:

APPLICATION

Customer Pressure Complaint

BENEFITS

- One person can do it all
- More accurate and reliable than chart recorders
- No exposed electronics collect data in the rain
- Electronically documented test results
- Easy to use kits available

OVERVIEW

One of the most popular uses for the Telog Hydrant Pressure Recorders (HPRs) is to monitor and analyze customer pressure complaints. The HPR is ideally suited for this application because it is rugged, highly portable and can give a complete, time stamped picture of the pressure differential between the customer's water pressure and the water pressure being delivered by the local utility.

Everything you need to investigate customer pressure complaints is available in this kit with a durable carrying case.

Attach an HPR to the hydrant that is closest to the customer's building and on the same main.

Attach a second HPR to the customer's water line. This can be done using a garden hose and an HPR with Telog's garden hose adapter. Fill the hose with water and attach the HPR. Once the HPR is securely attached, completely open the customer's spigot.

Data may be collected and viewed on-the-spot or back in your office. Once the data has been collected from both HPRs, it can be easily graphed in Telogers software.

In the example to the left, it is clear that there is approximately a 20 psi difference between the pressure at the customer's house and the water pressure being supplied by the water utility.

A graph of the data can be shown to the customer so that they clearly see the pressure differential and that the utility has more than adequate water pressure in the main.

APPLICATION

BENEFITS

Fire Flow Testing

- One person can do it all

OVERVIEW

Using Telog's HPR-31 units for fire flow testing provides you with more accurate information than conventional, manual methods of testing. Because the HPR is always recording and time stamping data, the testing can be performed and completed by one person. The testing procedure is based on guidelines in the NFPA 14 and the AWWA M17 manuals, so you will be sure to meet regulation requirements.

Everything you need to perform fire flow testing is in Telog's Flow Test Kit II-D.

Based on NFPA 14 and the AWWA M17 guidelines More accurate & reliable method than pitot gauges No exposed electronics — perform test in the rain

Attach an HPR unit to the residual hydrant and an HPR unit with diffuser to the flow hydrant. Using your Telog DTU, you will be able to do on-the-spot pressure analysis. All data is stored in the DTU for further viewing and analysis on your PC running Telogers for Windows software.

-	Flow Hydrant Flow Hydrant #47 Flow Rate #47 Flow Total				
	515.5	596.8			
	523.7	494.9			
	531.3	453.4			
	540.6	562.8			
	548.5	473.1			
	557.2	521.2			
	567.5	619.9			
	576.1	511.7			
	583.8	461.1			
	593.3	572.7			
	600.9	458.0			
	611.4	626.7			
	619.2	468.6			
	627.9	521.2			
	635.8	473.1			
	645.4	578.8			
	655.2	588.5			
	663.5	494.9			
	670.3	409.3			
	676.5	369.5			
	682.8	382.6			
	684.4	91.9			
	685.9	91.9			
	687.5	99.3			
	687.5	0.0			
	687.5	0.0			
	687.5	0.0			
	687.5	0.0			
-	687.5	0.0			

Pressure and flow data may be collected with your Telog DTU and transferred to your computer for viewing and analysis in Telogers for Windows. You can also download data directly from your HPRs to your computer. Both the residual hydrant and the flow hydrant data can be displayed simultaneously in Telogers software. You will be able to view a clear picture of the entire flow test.

The Telog DTU can also display the current pressure or flow data from an HPR.

APPLICATION **C**-factor Testing

BENEFITS

• One person can do it all

- More accurate and reliable than pitot gauges • No exposed electronics — perform test in the rain
- **O**VERVIEW

C-factor testing with HPR units will measure discharge and head loss. By using HPRs, a task which normally requires three or more people becomes a one-person job. There is no need to station a person at each hydrant. The HPR automatically records and time stamps the data. This information can then be used to calculate pipe roughness in terms of Hazen-Williams C-factor.

BENEFITS

OVERVIEW

Add to Your Flushing Program

- Hydrant capacity testing
- Capture peak flow rate for color coding

 - One person can do it all

Numerous water authorities have instituted flushing programs to help maintain the health of their distribution system. In many mains, water moves through at less than two miles per hour. Flushing removes built up sediment that restrict the water. When you use the Telog Hydrant Flow System you can simultaneously accomplish two other important functions — hydrant capacity testing and reduce unaccounted for water.

Attach HPRs to the Upstream and Downstream hydrants and close valve(s)

Use your Telog DTU to observe the static pressure at the upstream and downstream hydrants 4.87

Collected data will give you what is needed for C-factor calculations and can be read from a graph such as the one on the left.

Hydrant Capacity Testing

The peak flow rate of the hydrant can be read from your Telog DTU. Using this information, you can determine the appropriate color-coding of the hydrant.

Unaccounted for Water

• Reduce the amount of unaccounted for water

Bonnet and Cap Color-code RED — Less than 500 GPM **ORANGE** — 500 to 999 GPM **GREEN** — 1000 to 1499 GPM LIGHT BLUE — 1500 or more GPM

This hydrant flowed less than 500 gpm, therefore, it's caps and bonnet are painted **RED**.

When you use Telog's Hydrant Flow System to flush your hydrants, the total gallons flowed during a hydrant flush are automatically recorded. This reduces the amount of unaccounted for water in your distribution system.

APPLICATION

Calibrating Hydraulic Models

BENEFITS

- Use exported HPR data in your modeling software for:
- Model calibration data
- Steady-state analysis
- Extended-period analysis
- Data is stamped with time and date
- More accurate, reliable and flexible than pitot gauge

OVERVIEW

Fire flow testing and C-factor testing are two of the most common field tests used for model calibration. Using Telog HPRs can greatly simplify that testing (see Telog's application notes on fire flow & C-factor testing) and the data from Telogers software can be exported to many of today's software modeling packages.

In time series analysis you can study your system over an extended period of time. Fill and drain cycles of tanks, pump and valve response, as well as daily fluctuations in usage, can all be simulated using time-series analysis. The HPR easily collects and exports these data to your modeling software package.

> All HPR data are date and time stamped. The combination of HPRs and Telogers software is well suited to collecting, displaying and exporting time-series data. The pressure data in the graph to the left was stored in 1 minute intervals, but for our time-series analysis we wanted 15 minute averages from 3 pm to 6 pm. As you can see, the tabular data is displayed in 15 minute averages and the desired period is highlighted.

In There are several ways to export data from Telogers software. Data can easily be exported to 3rd party software packages such as Microsoft Excel, Microsoft Word, various HMI and Modeling packages.

Telog has an ongoing committment to continuously work with hydraulic modeling software manufacturers to further simplify data transfer between software applications.

Typical Applications Using Telog Recorders

Recording rainfall

III.

The buriable antenna is used for underground remote data transmission where fixed cellular antennas cannot be used.

Anatomy of HPR-31 Kits

Inflow & Infiltration Alarm Notification

Rain fall data and wastewater flow data are sent to the host computer via wireless communication. Data is correlated at the host computer to provide alarm notification.

Water Level Recording -

Wireless communication or direct connect options
